Edge-AI Vision Analytics with Cloud Control

This demo features the **Advantech ICAM-540**, an industrial AI camera built on the NVIDIA Jetson Orin NX. NVIDIA DeepStream runs PeopleNet with object tracking on the live feed, counting visitors crossing a virtual line, booth occupancy and dwell time, while IoTConnect commands add video streams and switch models to push the GPU to its limit.

IoTConnect charts per-stream FPS, GPU load, power and temperature beside the booth analytics, and each dashboard button regenerates the DeepStream pipeline on the camera. A vision-language model answers plain-English questions about the live scene.
